All deaths reported in Pennsylvania shall be determined in accordance with the Uniform Determination of Death Act of 1982.\(^1\) Within four days, the report of death shall be filed with the Bureau of Health Statistics and Registries in accordance with the Vital Statistics Law of 1953\(^2\) (VSL). The funeral director (or person in charge of interment) shall complete the personal and demographic portion of the report of death, while the medical certification shall be completed as described in this state registrar notice.

**Medical Certification of Deaths**

The medical certification of all reports of death\(^3\) shall be completed by a medical professional who attended the decedent during the last illness. A medical professional is defined as a physician, certified registered nurse practitioner, physician assistant, or dentist who is a staff member of a licensed healthcare facility\(^4\). If the decedent is a family member of the medical professional or the medical professional is physically unable to certify the case, then the case shall be referred to another medical professional at that facility.

The VSL authorizes a medical professional to refer a case to a county coroner\(^5\) or medical examiner only in the following two scenarios\(^6\):

- If another medical professional of the licensed healthcare facility is unavailable or unwilling to medically certify the death, or
- If the circumstances surrounding the death suggest that the death was sudden, violent, suspicious in nature, or was the result of other than natural causes.

---

\(^1\) 35 P.S. §§ 10201 – 10203.
\(^2\) 35 P.S. § 450.501
\(^3\) A report of death is an electronic report submitted through the Electronic Death Registration System (EDRS) or a paper form titled “Certificate of Death” (H105.143).
\(^4\) A health care facility as defined in the Act of July 19, 1979 (P.L.130, No.48), known as the Health Care Facilities Act.
\(^5\) An elected or appointed coroner or an elected or appointed medical examiner as defined in Act of August 9, 1955 (P.L. 323, No.130)
\(^6\) 35 P.S. § 450.503.
The medical certification of a report of death shall also be completed by the county coroner or medical examiner from the county where the death occurred in the following scenarios:

- The manner of death is accident, homicide, suicide, pending investigation, or could not be determined.
- The medical professional that attended the decedent during the last illness or a professional nurse who was involved in the direct care of the patient was not in attendance during the last illness of the decedent.
- A medical professional was not in attendance at time of delivery of a fetal death.

**Cause of Death**

The cause of death section of the report of death follows guidelines issued by the World Health Organization (WHO). If completed properly, the cause of death section provides an etiologic explanation of the order, type, and association of events resulting in death.

Medical professionals are to use their best medical judgment when completing the cause of death section. County coroners and medical examiners should use information obtained from their examination and/or investigation to complete this section of the report of death.

The cause of death section (shown in image below) consists of two parts: Part I is used to report the chain of events that led directly to the death and Part II is used to report other significant diseases, conditions, or injuries that contributed to death but which did not result in the underlying cause of death. For more in-depth instruction, see “Instructions for Completing the Cause of death Section of the Death Certificate” issued by the Center for Disease Control and Prevention (CDC).

---

7 35 P.S. § 450.503.
8 Professional nurse licensed under the act of May 22, 1951 (P.L. 317, No. 69) known as “The Professional Nursing Law”.

For statistical and research purposes, it is important that the cause of death be reported as specifically and precisely as possible. This information is used for public health surveillance, outbreaks and public health emergencies. Every cause of death statement is coded and tabulated by the CDC according to the latest revision of the *International Classification of Diseases* (currently ICD-10).

**Part I – Chain of Events**

Enter the sequence of medical conditions that had the greatest impact on causing the death and the time interval between the onset of each condition. The immediate cause of death is entered first with the underlying cause entered as the lowest line used in Part I. Do not abbreviate when entering cause of death information.

The mechanism of death or terminal event, such as cardiac or respiratory arrest, should not be reported as it is a statement not specifically related to the disease process, and merely attests to the fact of death. The mechanism of death or terminal event, therefore, provides no additional information on the cause of death.

**Line A: Immediate Cause of Death**

The immediate cause of death is the final disease, injury, condition, or complication directly causing death of the decedent. All reports of death must include an immediate cause of death. List only one condition as the immediate cause of death. The immediate cause may be the sole entry in the cause of death section if that condition is the only condition causing the death.

**Lowest Line Used: Underlying Cause of Death**

The underlying cause of death is the disease or injury that initiated the change of morbid events that led directly and inevitably to death. The underlying cause should be specific and precise, so that there is no ambiguity about the etiology of this cause.

The underlying cause of death should be entered on the lowest line used in Part I of the cause of death section. List sequentially all conditions that developed due to the underlying cause which lead to the immediate cause of death.

If the underlying cause has not been definitely diagnosed, the condition may be qualified as being “probable”, “presumed”, or “likely”. Once definitely diagnosed, the death record should be amended.

If the decedent has microscopic examinations or autopsy results pending at time the report is filed, include wording such as “pending test results” by the disease or condition being reported. Once the test results have been received, the medical certifier that originally signed the report of death shall submit a request to amend the death record based on this additional information.

If the coroner or medical examiner is unable to determine the immediate cause of death until postmortem examination results have been received, the cause of death may be reported as “pending” or “pending investigation” so that the report of death is filed within four days. Once
the additional information has been received, the coroner or medical examiner shall submit a request to amend the death record based on the additional information.

Part II – Significant Conditions Contributing to Death

Enter all diseases or conditions contributing to death that were not reported in the chain of events in Part I and that did not result in the underlying cause of death. If two or more possible sequences resulted in death or if two conditions seem to have added together, report in Part I the one that in your opinion most likely caused the death. Then enter the other condition or disease in Part II.

Timely Reporting of Deaths

In accordance with the VSL, all deaths must be fully reported within 4 days of the death occurring. Full reporting requires that the funeral director (or person in charge of interment) sign the personal and demographic portion of the report of death, and that a medical professional, coroner or medical examiner has certified the medical portion of the report of death.

General Guidance and Training

The following resources are available for general guidance and training on cause of death reporting is available from the CDC as follows:

- Online training module titled “Improving Cause of Death Reporting“ available at https://www.cdc.gov/nchs/nvss/improving_cause_of_death_reporting.htm. Continuing Medical Education (CME) and Continuing Nursing Education (CNE) credits are available to medical professionals that successfully complete this course.

9 35 P.S. §450.501.
Pennsylvania’s Electronic Death Registration System (EDRS)

In 2019, almost 92,000 or 70% of all deaths were reported through EDRS. EDRS improves the quality and timeliness of death data reporting which is critical for public health surveillance, outbreak detection, and public health emergency response.

For more information on EDRS including training materials and upcoming training webinars, visit the EDRS website at www.doh.pa.gov/edrs.
